5. METHODOLOGY AND DATA SOURCES

This analysis uses multispectral imagery from the Sentinel-2 L2A satellite (ESA Copernicus Programme) obtained via **BDC/INPE — Brazil Data Cube (Sentinel-2 L2A)** to compute the

Normalised Difference Vegetation Index (NDVI). NDVI is calculated as $(\text{NIR} - \text{Red}) / (\text{NIR} + \text{Red})$, using bands B08 (Near-Infrared, 842 nm) and B04 (Red, 665 nm). EUDR compliance is assessed by comparing the mean NDVI between December 2020 (the EUDR cut-off date under Regulation (EU) 2023/1115, Art. 2) and the current analysis date. The deforestation detection threshold is a drop of 0.15 NDVI points.
